

SIMULATION MODELING OF PRE AND POST PROCEDURE BEDS FOR THE INTERVENTIONAL PLATFORM SSM SAINT LOUIS UNIVERSITY HOSPITAL

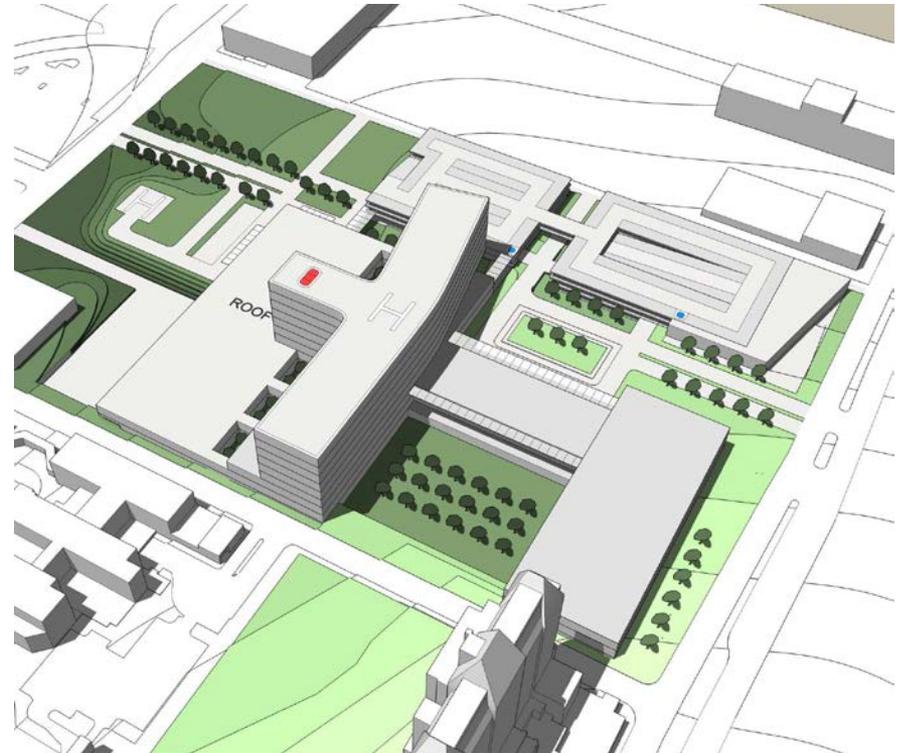

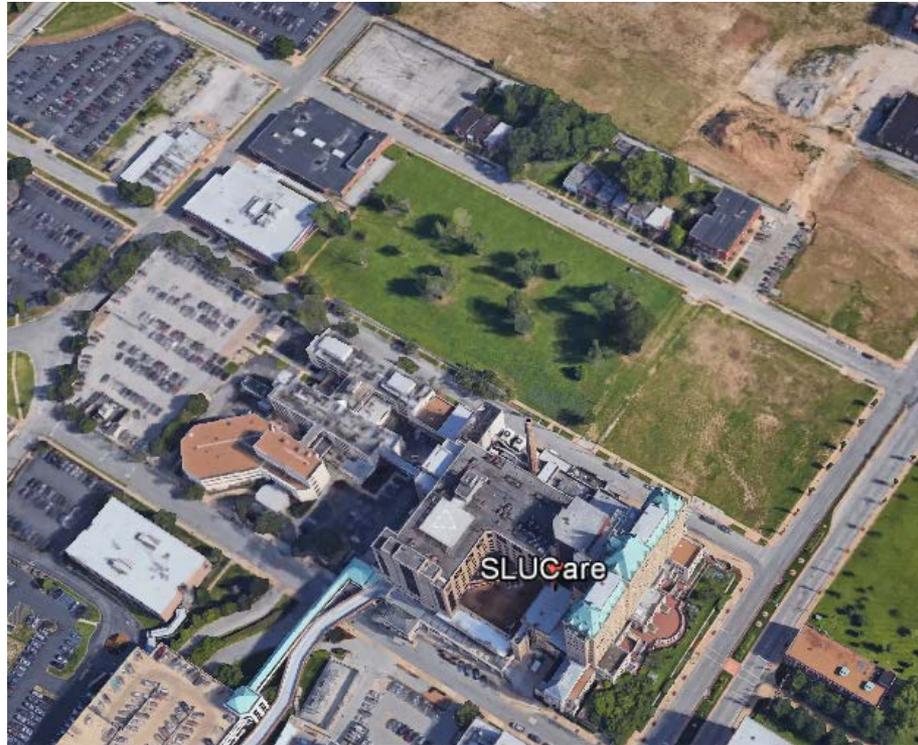

Frank Zilm, D.Arch, FAIA, FACHA
Chester Dean Director of the Institute for Health and Wellness Design
The University of Kansas

Presentation Agenda

- Overview of Interventional Platform
 - Visioning future process
 - Development of model
 - Output/evaluation
 - Questions
- 

SSM St. Louis University Hospital Renewal Project

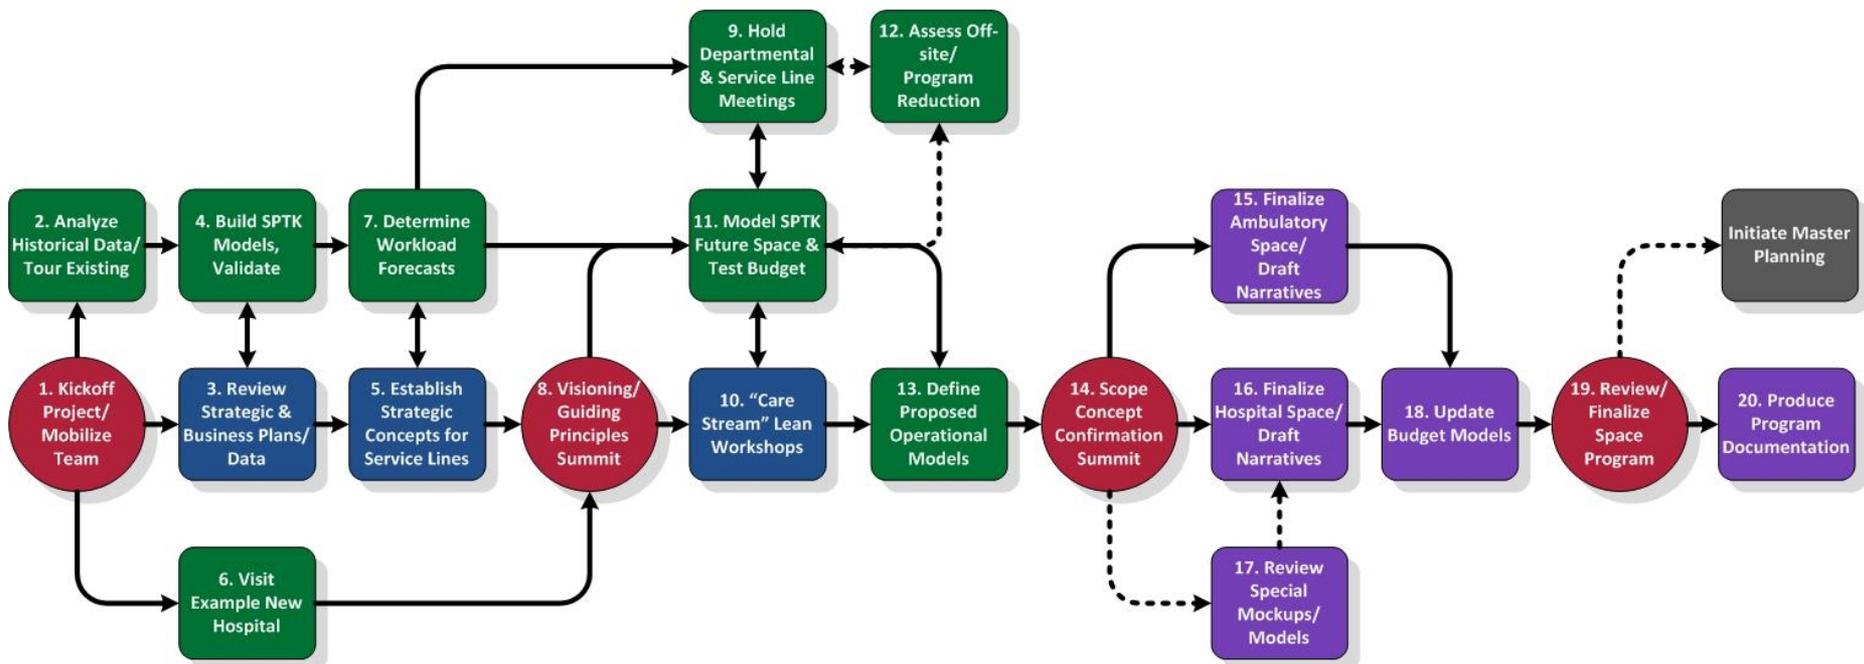

Planning Approach

**SSM St. Louis University Hospital
Medical Campus Renewal Project**

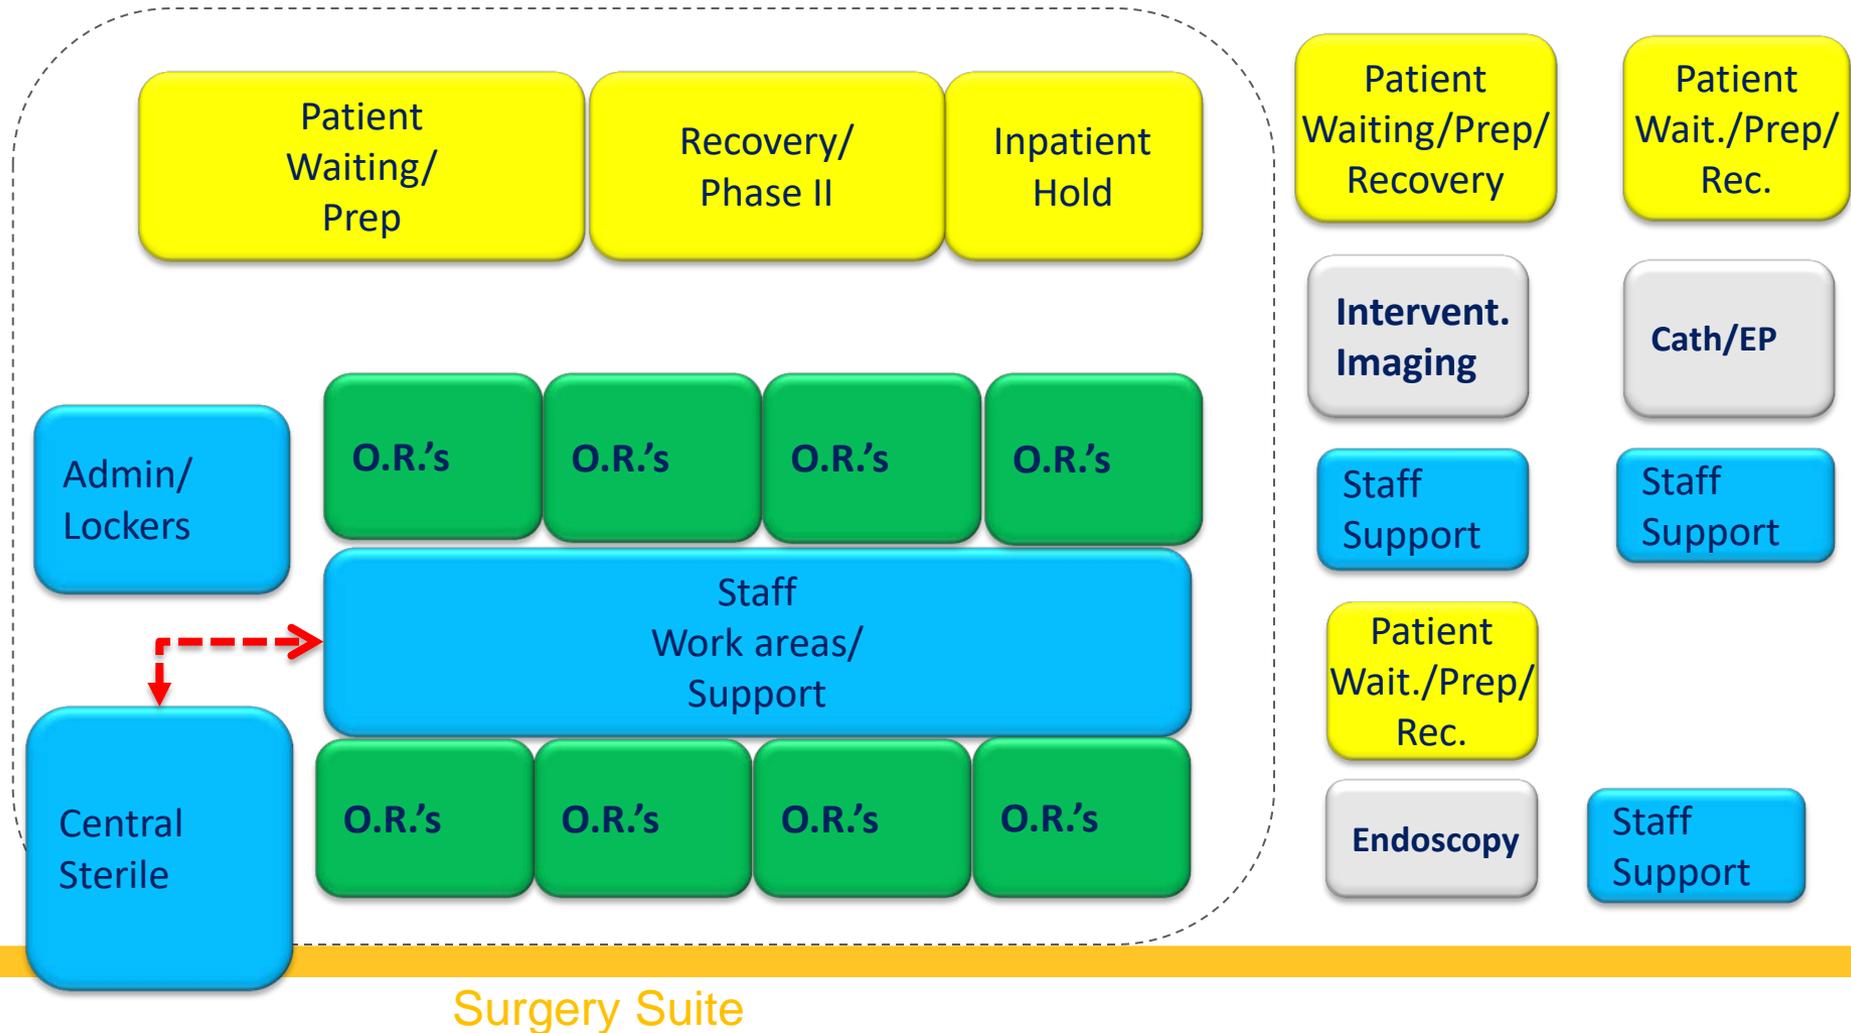

Proposed Planning and Programming Process

Color Key:

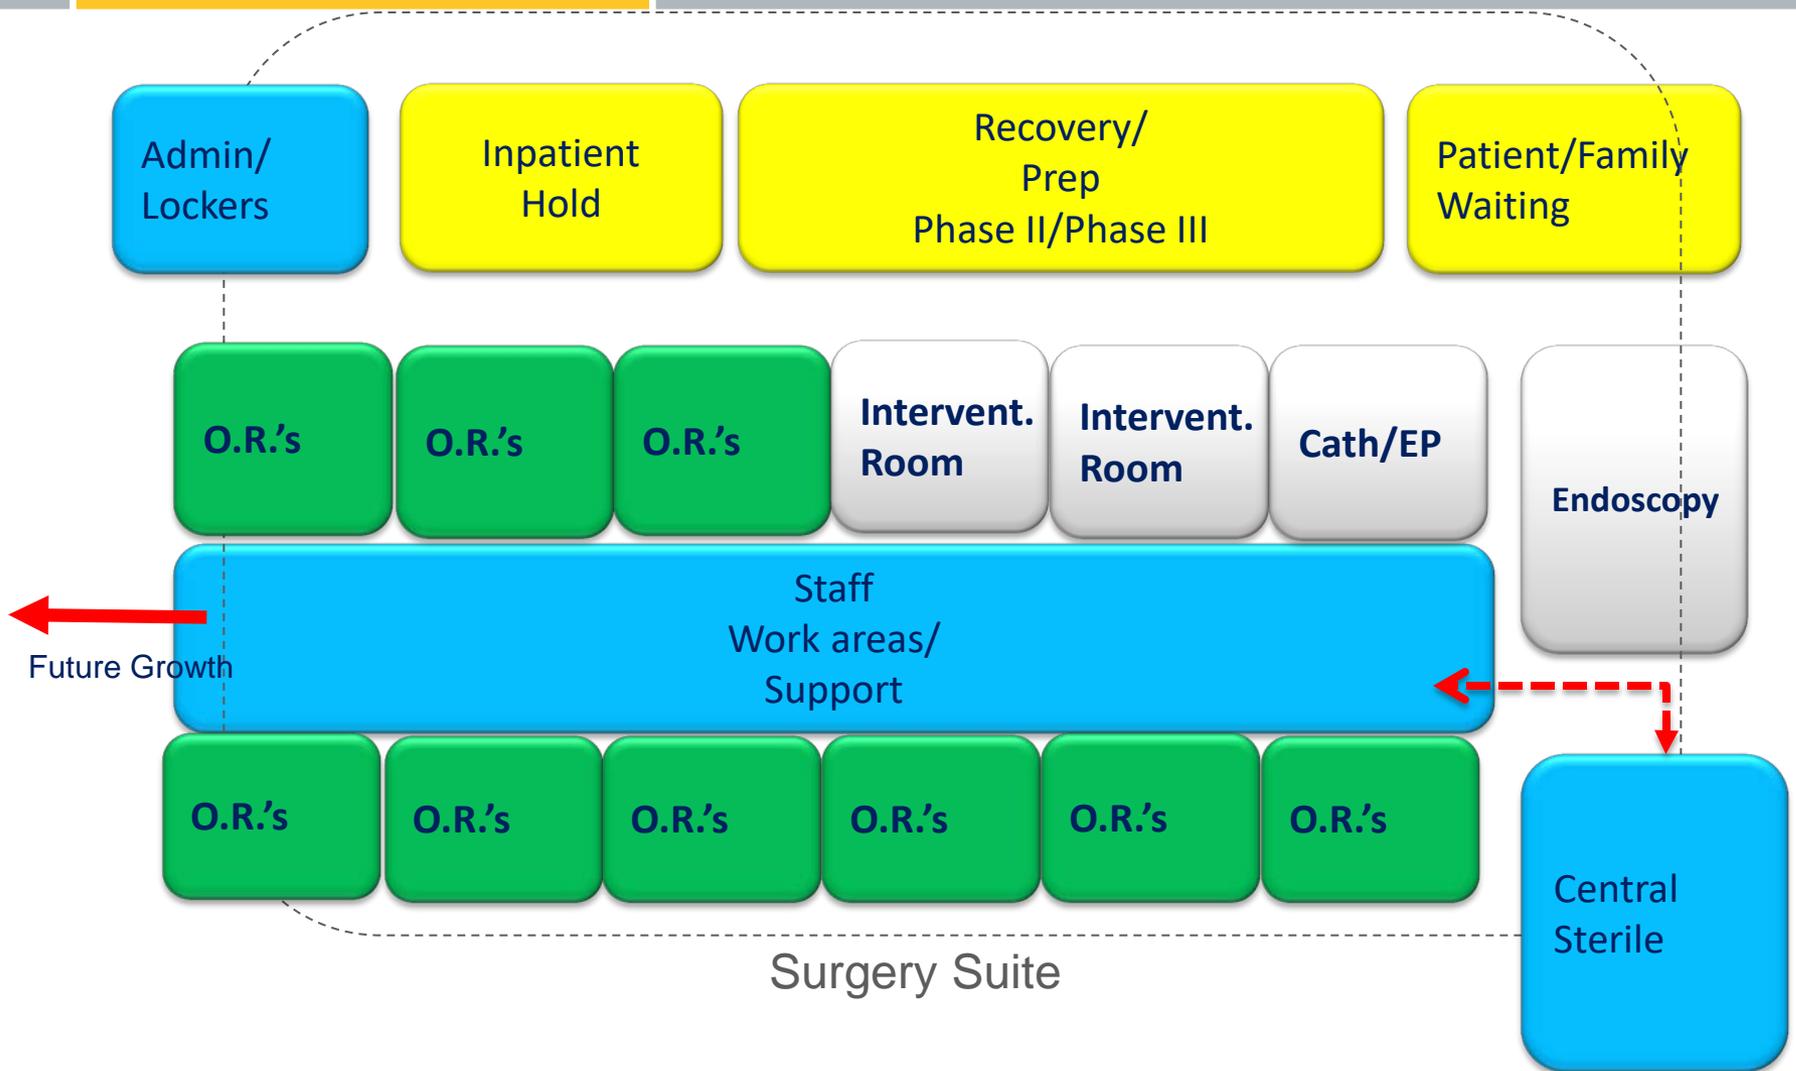

- Task Strategic Analysis
- Task Operational and Functional Planning
- Task Space Programming

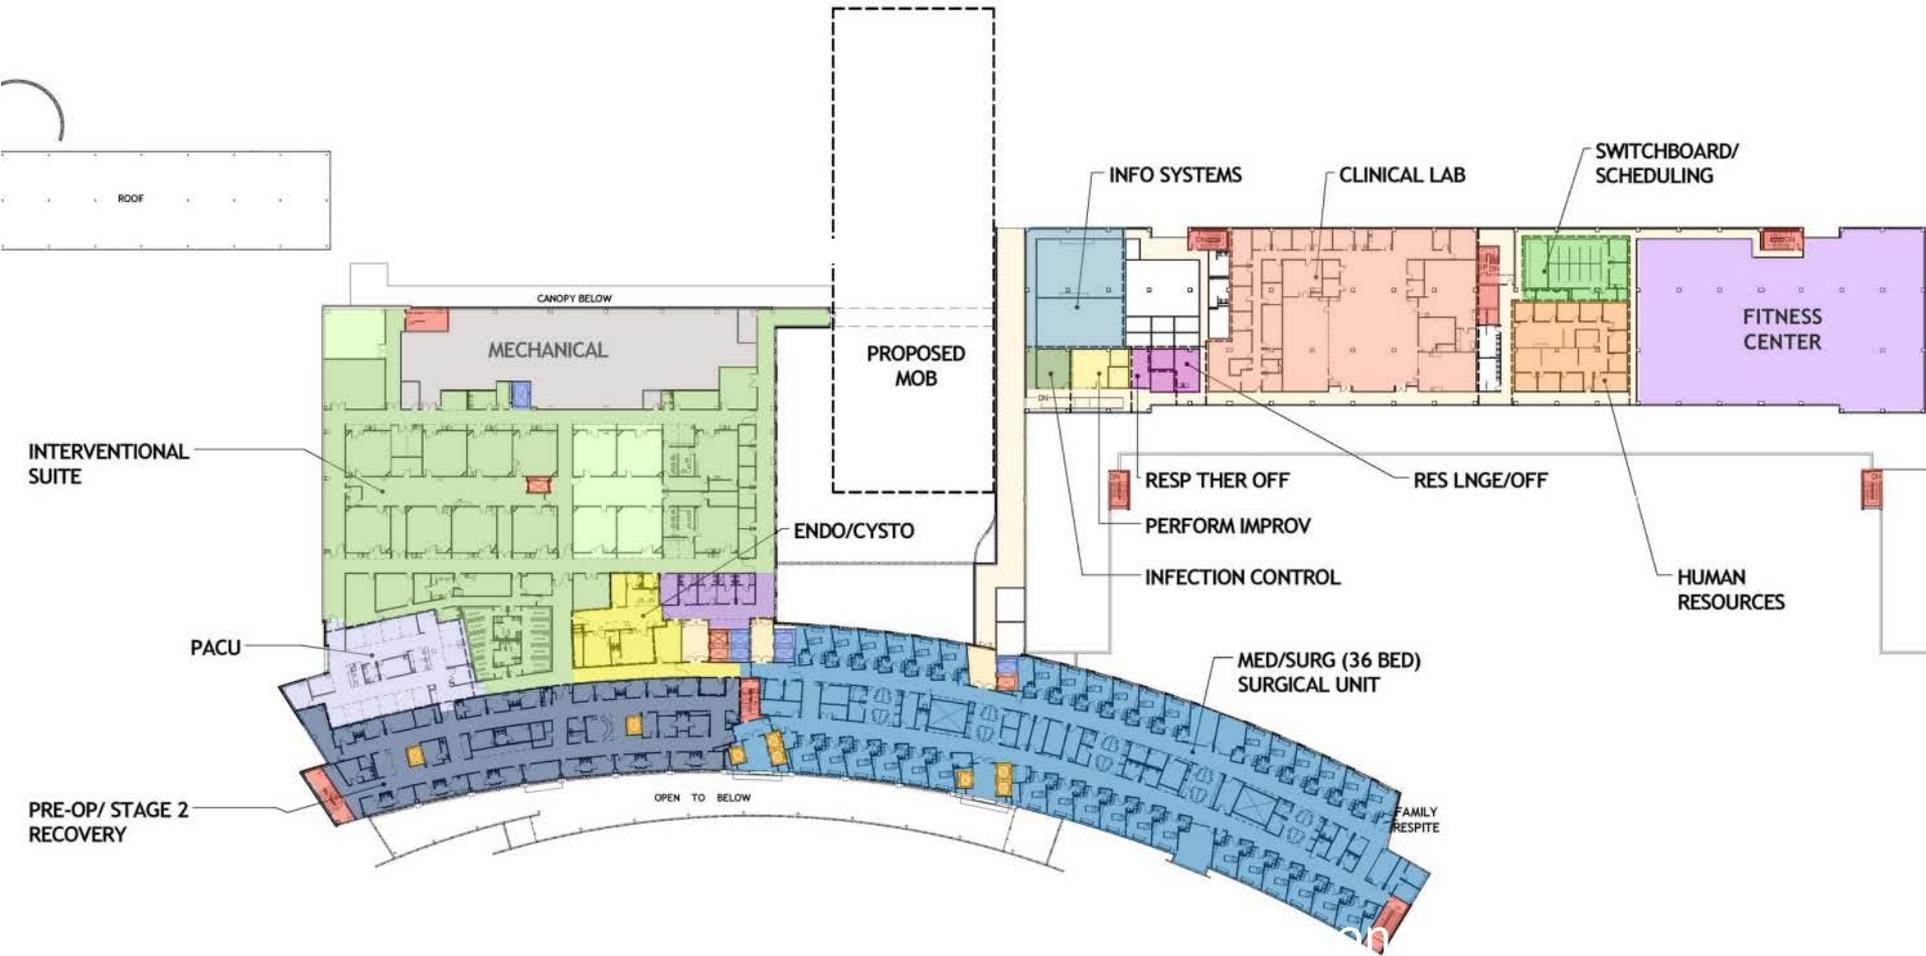

Traditional Model

Interventional Suite

Space List

Interventional Platform					
AREA/ROOM	NSF/ Unit	# of Units	Total NSF	Subtotal	Comments
Public/Family					
1 Waiting Area	20	64	1,280		32 total rooms 2 per room.
2 Coat Alcove	30	1	30		
3 Computer workstation	20	4	80		
4 Nourishment alcove	80	1	80		
5 Volunteer desk	40	1	40		
6 Public Toilets	180	2	360		
7 Family Consult	120	4	480		
8 Consultation alcove	60	1	60		
				2,410	
Pre-op/Phase II Holding					
9 Holding/Recovery Rooms	120	40	4,800		One per procedure room
10 Lounge areas for patients/family	60	16	960		Phase III recovery, sub divide for Endo
11 Charting alcove	15	20	300		
12 Patient clothes storage closet	120	1	120		Holding garment bags w/ patient clothes
13 Medication Alcove	80	2	160		
14 Nourishment Alcove	80	2	160		
15 Clean Supplies	120	2	240		
16 Linen	80	2	160		
17 Soiled Holding	100	2	200		
18 Pneumatic tube area	10	2	20		
19 Charting/Work area	140	4	560		
20 Housekeeping Closet	30	2	60		
21 Stretcher Storage	80	1	80		
22 Patient Toilet	50	8	400		
23 Staff Toilet	50	2	100		
				8,320	

SSM St. Louis University Hospital Renewal Project

Interventional Platform Concept

Purpose of Modeling

- Identify proposed patient flows for services using the Interventional Platform (IP)
- Estimate bed requirements based on simulation models of proposed demand and flow. Components include:
 - PACU
 - Prep/Phase II
 - Phase III (recliner area)
 - Short stay (<23 hour observation)
- Test the sensitivity of the model results to key operational assumptions
- Recommend adjustments, if needed, to the IP space program

“Essentially all models are wrong, but
some are useful”

George Box, Professor Emeritus, University of
Wisconsin

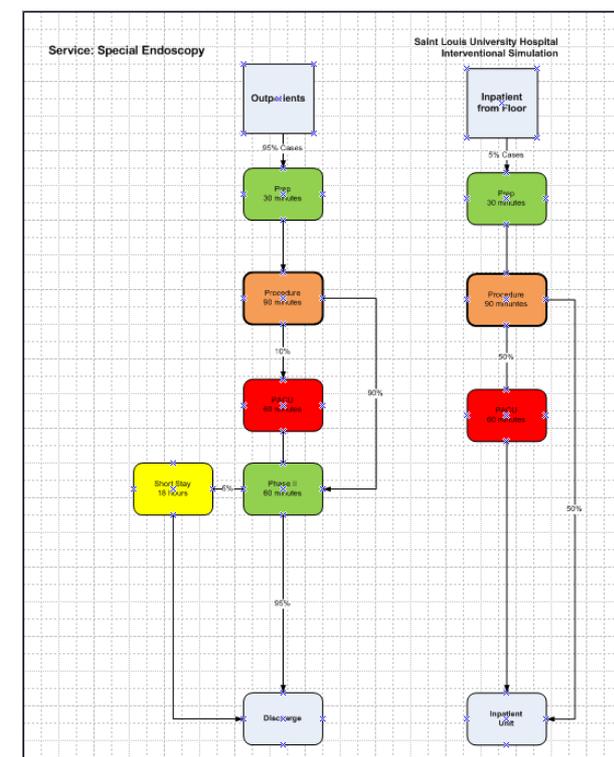

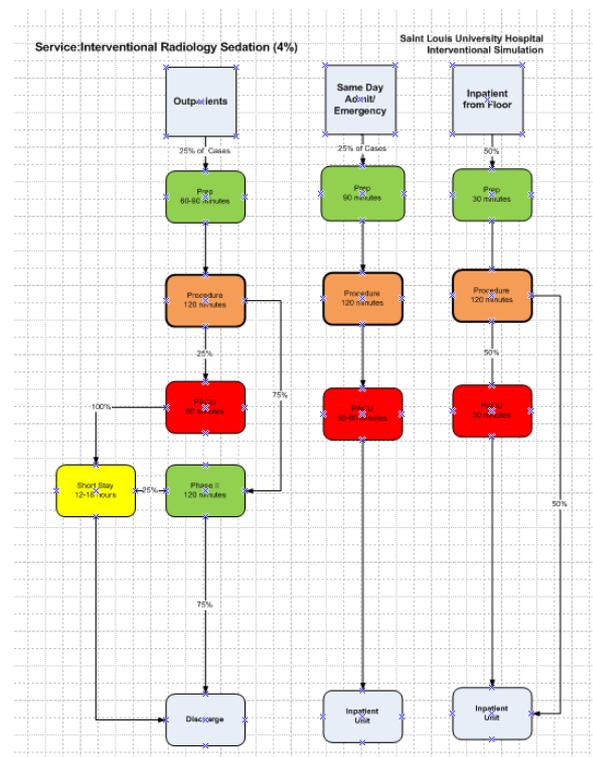

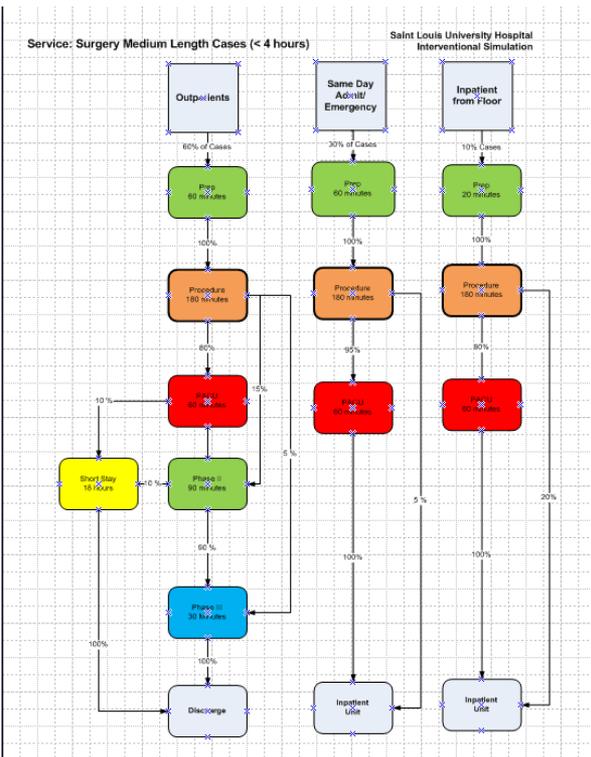

Process

- Meetings with staff from affected services to explain project goals and data needs.
- Development of anticipated flow steps for major patient types.
- Established prototype schedule for patients.
- Modeling of proposed system.
- Testing of sensitivity of model results.
- Review with staff.
- Recommendations of adjustments to space program.

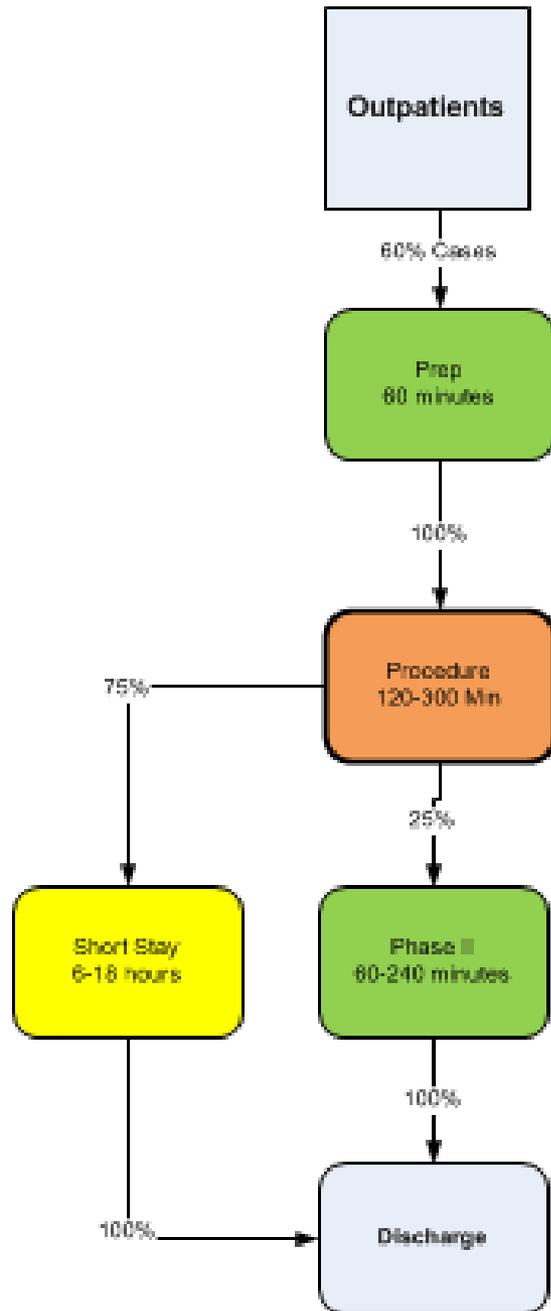

Examples of patient flows

- 18 types of patient procedures were identified for surgery, cardiology, interventional radiology and endoscopy.

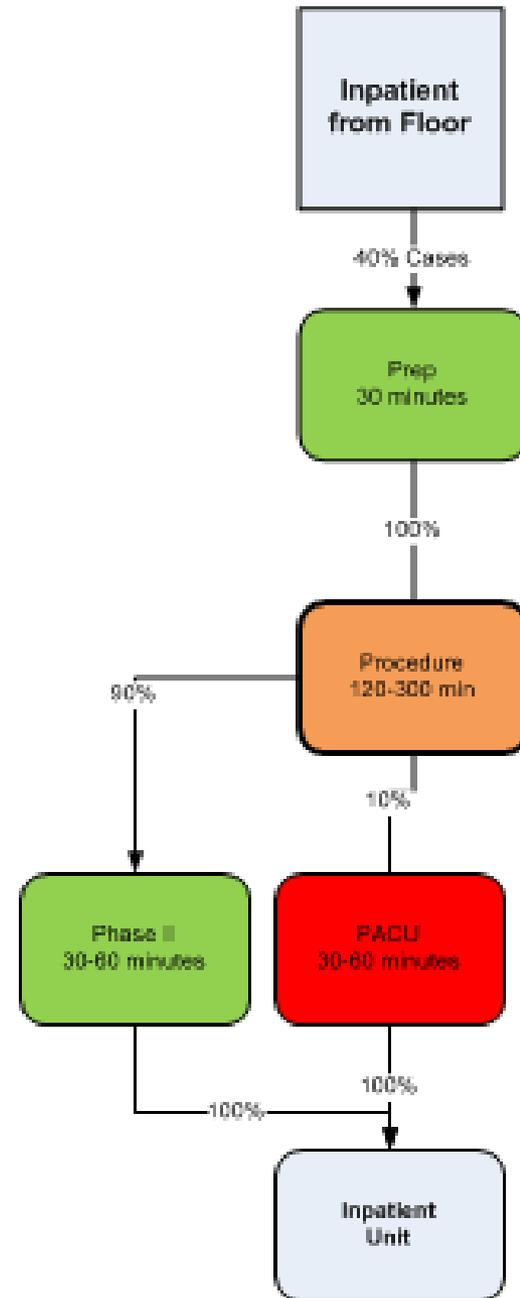

Example of patient flow diagrams

Service: Cardiology EP

Saint Louis University Hospital Interventional Simulation

Prototype schedules

- Prototype schedules were developed for each patient group

	Standard 12			ECT Out	ECT In

Resources (Beds) by Type

Resource Type	Count
Prep Phase II Bed	50
PACU Beds	50
Short Stay Beds	40
Phase III Beds	50

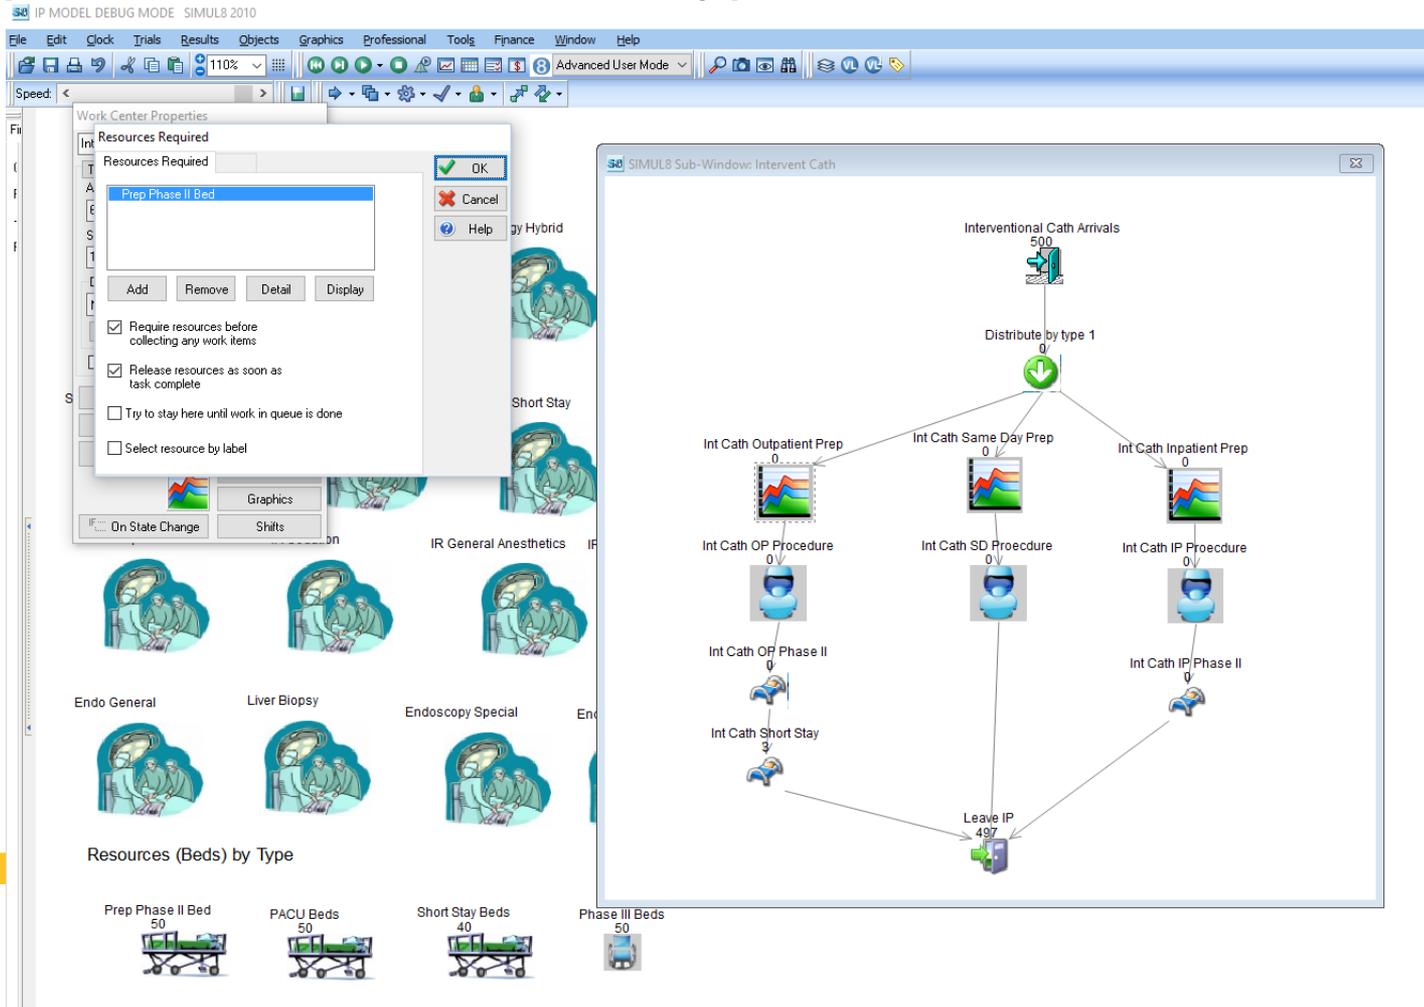

Model Development

- Arrivals and patient flow for each group were translated into a Simul8 model.

Model Development

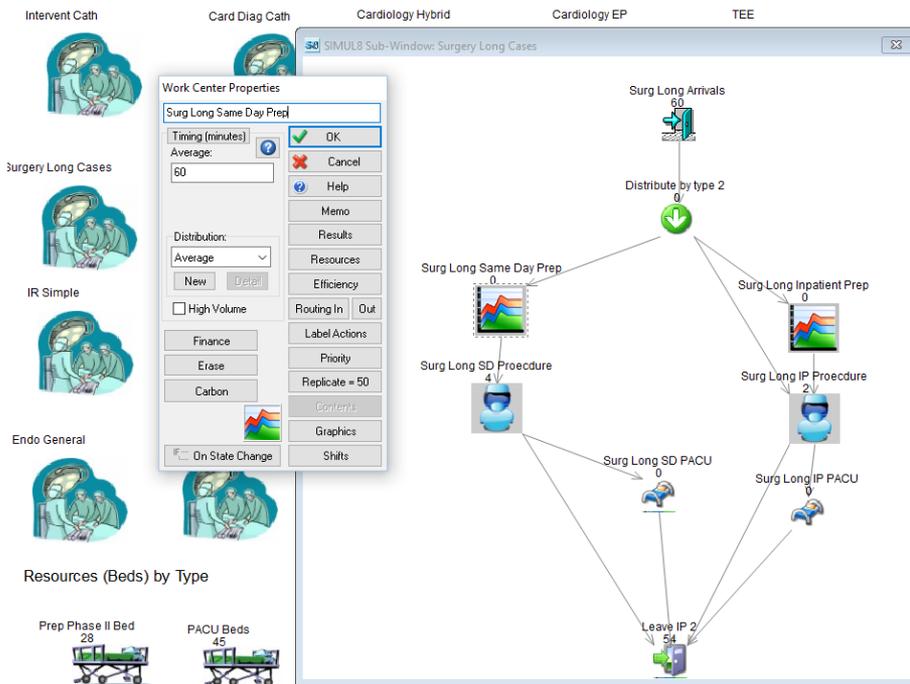

- As a patient moves through the Interventional Platform requests are made for the type of beds needed.

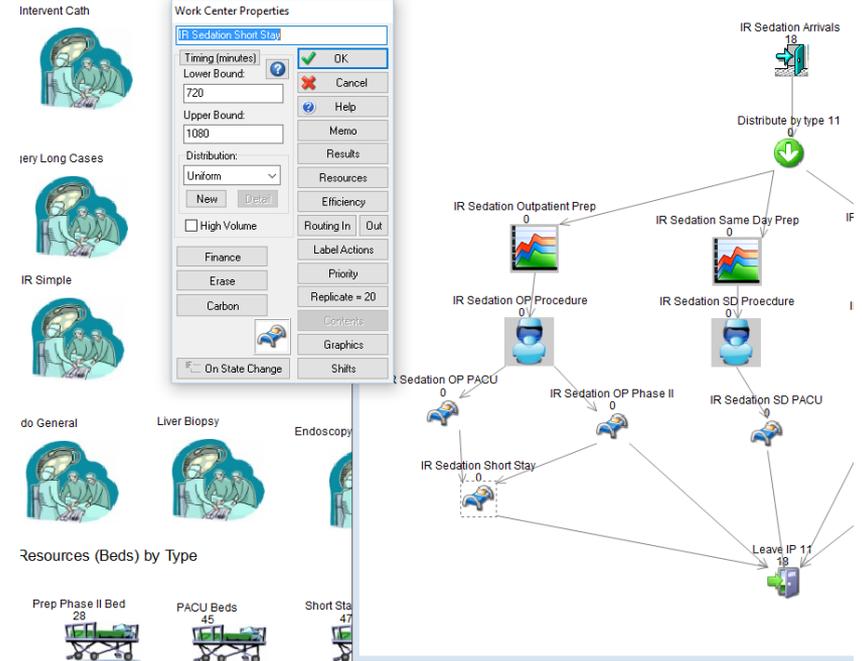

Model Development

- Variability was built into most steps in patient process. Normal or uniform distributions were typical distributions

Saint Louis University Hospital
Interventional Platform Simulation
April 20, 2016

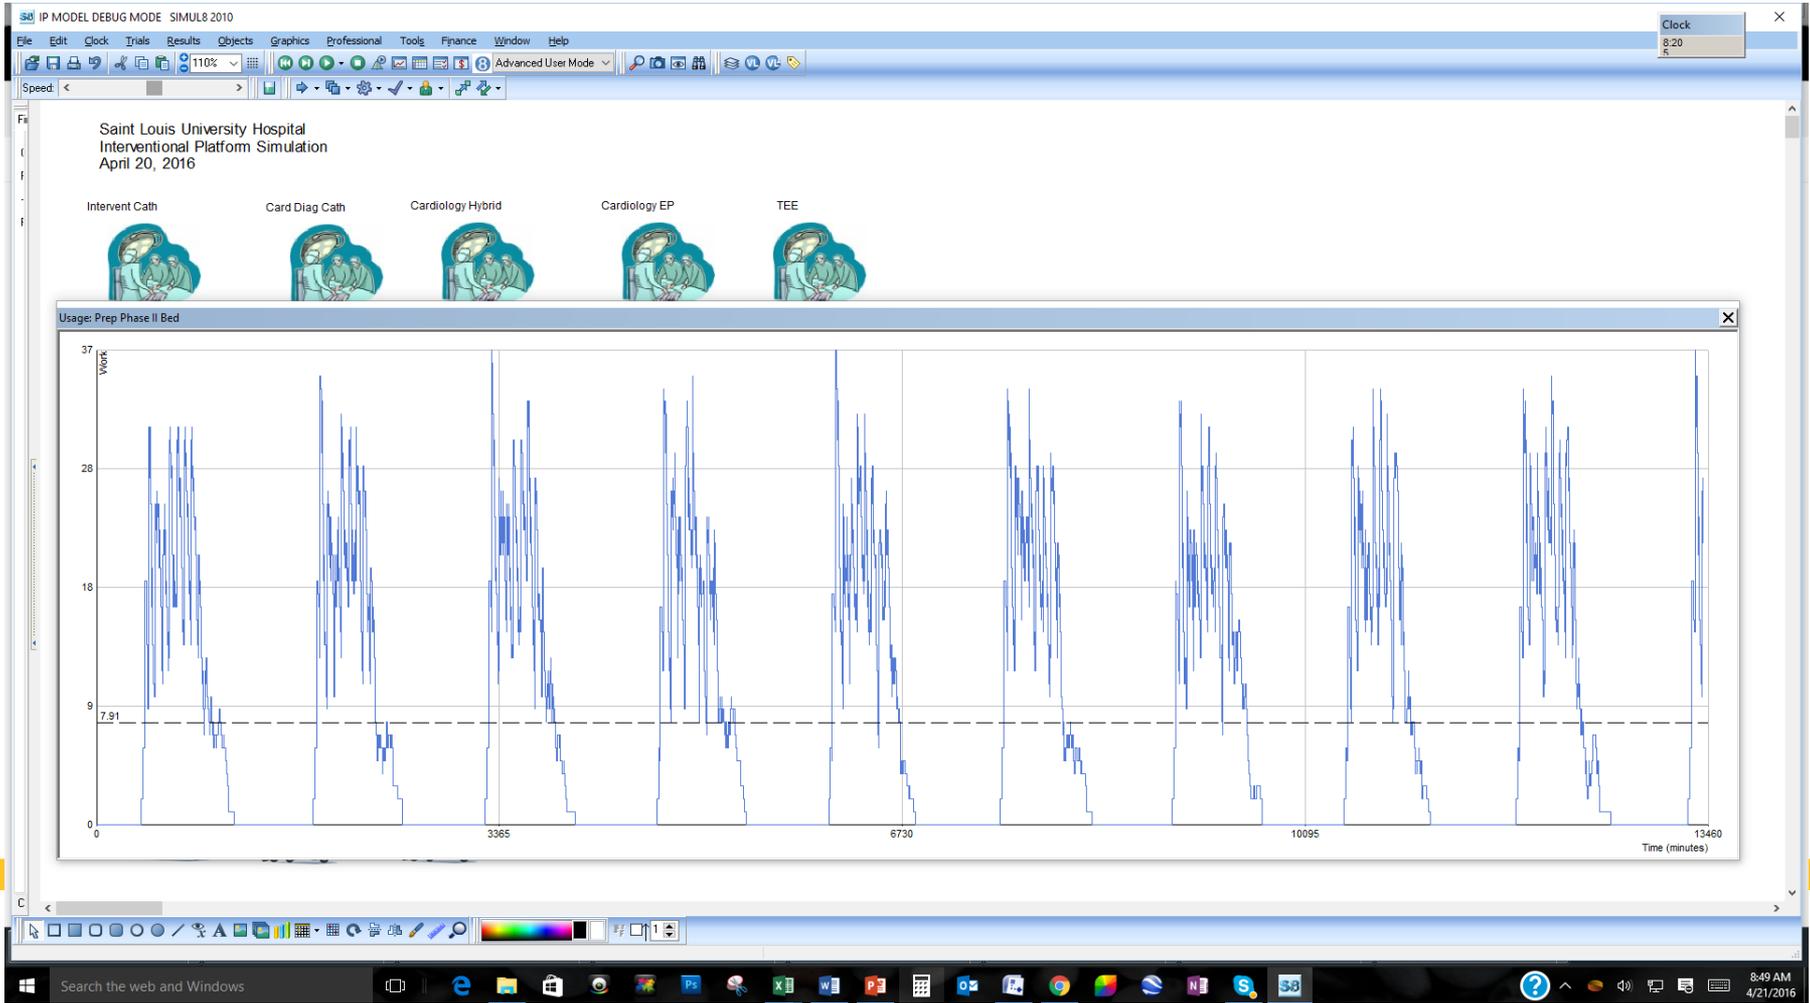

Saint Louis University Hospital
Interventional Platform Simulation
April 20, 2016

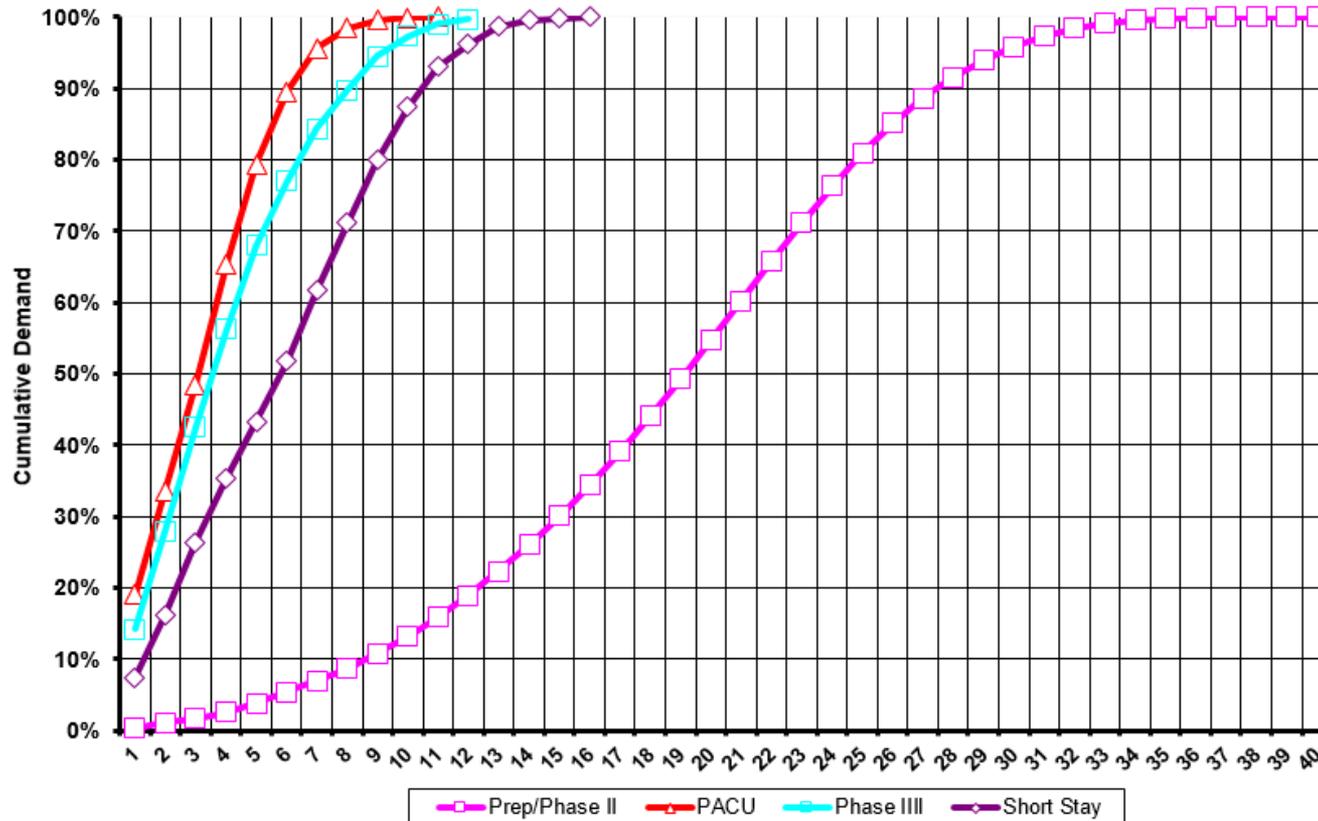

Model Development

- Total demand by all patients for each type of bed was recorded.

Initial Results

**Saint Louis University Hospital
Interventional Platform Simulation
Baseline Simulation**

Initial Results

	Prep/Phase II	PACU	Phase III	Short Stay
Current Program	56	20	16	10
Model Max Estimate	40	11	14	16

Key Model Issues/Questions

- Model assumes no holding in IP for inpatient bed availability
- Prep/Phase II assumes complete sharing of beds, no holding of beds by a service line
- Current model assumes most inpatients are held in prep area prior to procedure rather than PACU
- Mix of surgery patients has six rooms used by long case time procedures, reducing peak demand on PACU beds
- Only 30% of short duration surgery patients are routed to PACU
- Turn around times for bed space are assumed in patient LOS
- Does this reflect worst case demand?

70% of Surgery Short Cases to PACU

	Prep/Phase II	PACU	Phase III	Short Stay
Current Program	56	20	16	10
Model Max Estimate	41	13	13	16

70% of Surgery Short & All Long

Cases to PACU

	Prep/Phase II	PACU	Phase III	Short Stay
Current Program	56	20	16	10
Model Max Estimate	41	14	13	16

Add 5 minutes for clean up/turn

	Prep/Phase II	PACU	Phase III	Short Stay
Current Program	56	20	16	10
Model Max Estimate	44	12	13	14

Recommendations

- Shift 6 beds from Prep/Phase II beds to short stay, shell 6 Prep beds. (44 initial Prep/Phase II rooms, 16 Short Stay)
 - Shell 4 beds in PACU for future growth or adjustments for final operational strategies. (16 initial PACU beds, 4 shell)
 - Reduce Phase III to 14 stations
-
